

Getting Started With ScriptEase II

The goal of this tutorial is to build on the last tutorial, Making Your World, by fleshing out the world you have created in Scriptease II and making it more compelling. In this tutorial, we will use the world you created in the last one.

In this tutorial, we will make some text appear when we interact with the pirate flag, add a conversation to our Captain, and cause him to react to the player's responses to the conversation.

By the end of this tutorial, you should have a basic understanding of how to generate scripts for your game with Scriptease II and how to create conversations in Aurora.

Getting Started:

1. Go to your Neverwinter Nights directory. If you haven't done so, create a backup of TreasureIsland.mod by copying it and pasting the copy somewhere safe. Now, if you somehow destroy your module, you can always load up the previous.
2. Close the Aurora Toolset if it is open. You currently cannot open a module in ScriptEase II that is also open in the Aurora Toolset. A read-only feature for ScriptEase II is planned for the future.
3. Open ScriptEase II by double-clicking the "ScriptEase.jar" file or the icon on your desktop.
4. Create a new Story from the File menu. Name your story "Treasure Island", enter your name in the Author field, and write "A riveting tale of mutiny and treasure" in the description. Select "Neverwinter Nights" in the "Game" box and then browse to the "Treasure Island.mod" module under the "modules" folder. Click finish when you are done.

Tip: The Description and Author are only used by developers; they will not be visible to players.

5. ScriptEase II will now load your module (Figure 1).

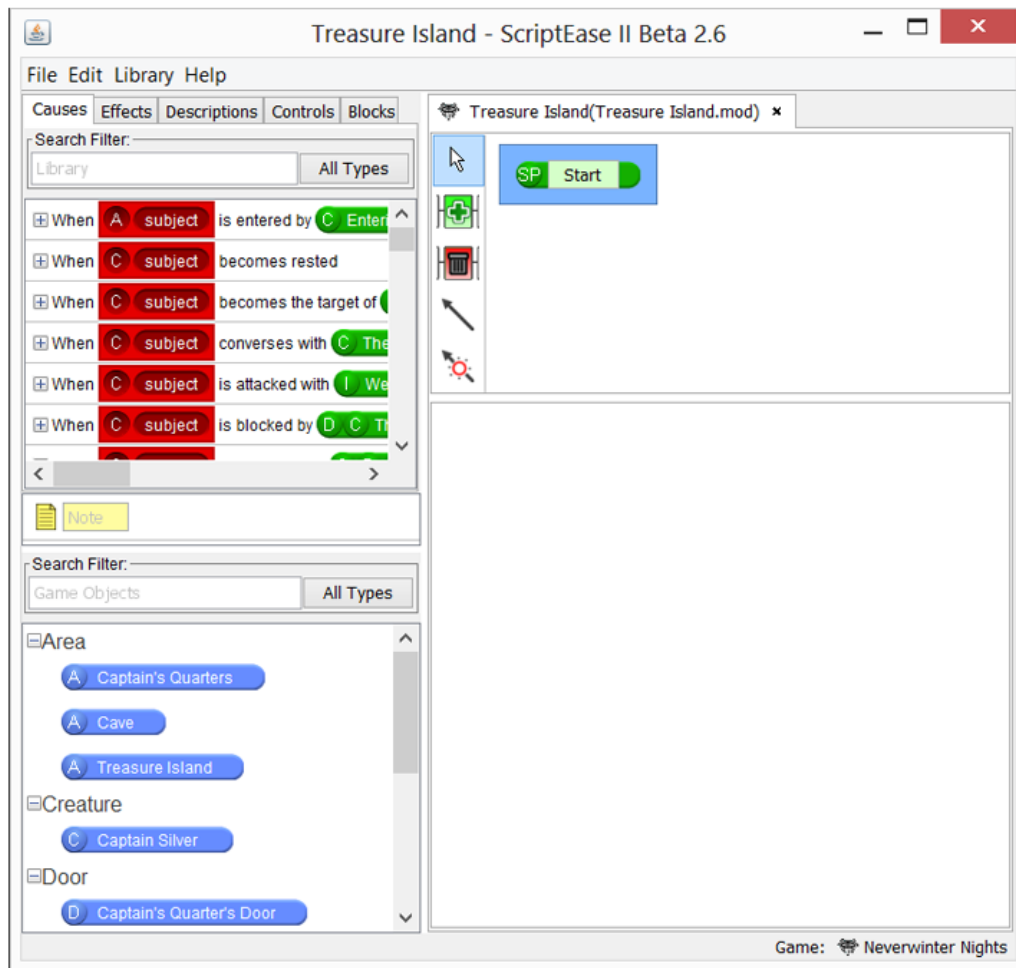

Figure 1

6. The left side contains all of the assets you can add to your story. The top part is the Library pane, which contains causes and effects that you can add to your story to make things happen. The middle section is the Note pane which you can also add to the story as textual reminders and comments for yourself but do not affect your story. Underneath this is the Game Object pane, which contains all of the assets in your module that can be dragged into causes and effects.

Tip: Remember how the previous tutorial stated that you need to create blueprints for important objects? Only objects with blueprints in your module will show up in the Game Object pane.

7. The right side represents your game's story. The story graph on top is used to create a basic overview of your story using Story Points. Underneath the graph is the Story Point pane. This pane represents what is inside of the currently selected Story Point. This is where you drag in your causes and effects.

Tip: Notice that the right side is in a tab. You can open multiple stories in ScriptEase II, with one tab per story.

Now that we have the basics down, let's get started!

Scripting Game Objects with Causes and Effects:

8. Let's start by renaming the first Story Point in the story point graph. Click on "Start", replace it with "Treasure Island", and then press enter when you are done.
9. For our first script, let's give the player some context to the story when they click on the pirate flag. We need the cause called "When subject is used by last user". ScriptEase II has a lot of causes, so let's find it by searching for the word "used" in the search box in the library pane at the top left corner. You can press "Enter" after typing it in to prevent the search bar from waiting for you to type more.
10. Drag the cause "When subject is used by last user" into the Story Point pane on the bottom right of ScriptEase II (Figure 2). You will notice that there is a component called "Is Active describes if Treasure Island is active". Components with the word "describes" are what we call descriptions, which we will cover later. Below it is a question called "Is Active" with Yes and No parts. There will be more on this later, too. What you need to know now is these two components will show up in every cause you create. Any effects dragged into the Yes part will only occur when this story point is active. Likewise, any effects in the No part will only happen when the story point is inactive. Any effects dragged outside of these two parts will happen regardless of which story point is active. The first story point is always active by default. Succeeding it, which makes it inactive, will be discussed more in depth later as well.

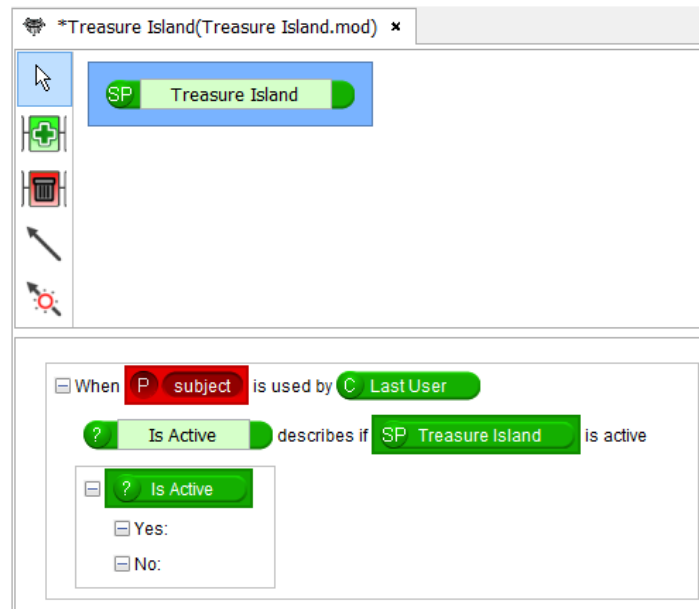

Figure 2

11. This cause needs a subject. Let's find the Pirate Flag in the Game Object pane below the Library. Once you find it, drag the blue Game Object into the subject slot inside the cause.

Tip: You can search in the Game Object pane just like in the Library pane.

12. We now have a complete cause. But it doesn't do anything yet! Let's add an effect. Click the "Effects" tab in the Library pane and search for "speaks". Drag the "Subject speaks Text at Talk Volume" effect directly into the cause, above "Is Active".
13. Write "All hail the new Captain of the Hispaniola!" or something similar in the text box of the effect. **Do not include the double quotes or you will get an error later.** Leave the volume box alone (Figure 3).

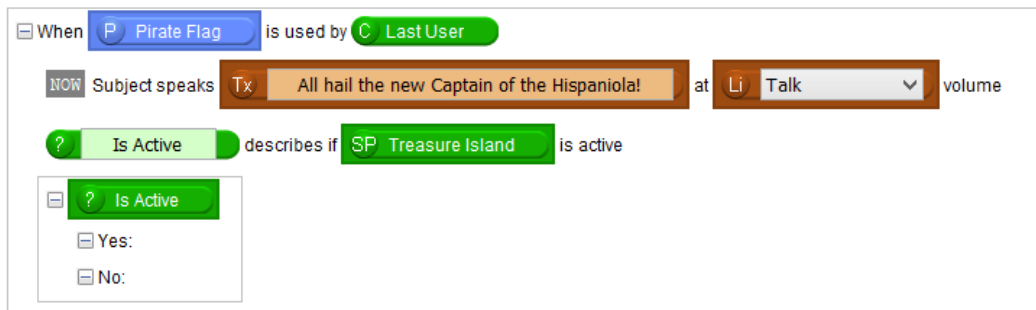

Figure 3

14. Save your story by going to "File" → "Save" in the menu. You can save this SE2 story file anywhere. Saving will add the scripts to your module and compile it for you. Let's test it out by pressing F9, just like in Aurora. Start up the game and click on the pirate flag to see the text appear.

Tip: If you encounter any problems with saving or testing the story, please refer to the ScriptEase II instructions.

15. You have added your first script to the game! Let's add some more scripts to progress the story.

Adding Conversations:

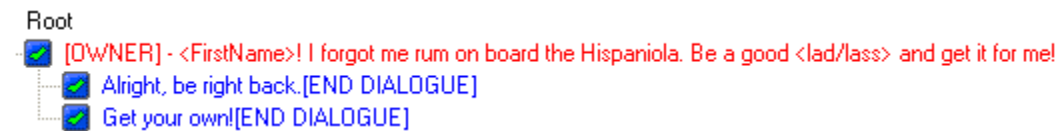

16. After making sure you have saved your story, close the story in ScriptEase II. You can do so by closing the tab that says Treasure Island (Treasure Island.mod). Open the module in Aurora. If you look in the "Scripts" category in the assets view, you will notice that ScriptEase II added a few scripts.

You could make changes to these scripts, but ScriptEase II will discard them the next time you save the module with it. If you want to write your own scripts manually, make sure that they do not start with "se_".

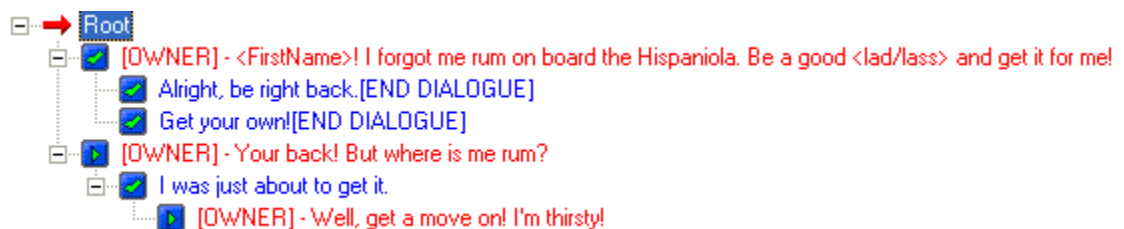

17. Let's add a conversation to our game. Right click on "Conversations" in the asset view on the left and click "New". The "Conversation Editor" will open up. Right click on "Root" and click on "Add". In the box that pops up, write "<FirstName>! I forgot me rum on board the Hispaniola. Be a good <lad/lass> and get it for me!" (without the quotes), and Click Ok.

Tip: You probably noticed that <FirstName> and <lad/lass> look different than the rest of the text. These are “Tokens” that show special text based on the converser. For example, <lad/lass> will automatically be replaced with “lad” if the character is male or vice versa if they are female. You can see a list of all of these tokens in the “Conversation Editor” by clicking on 

18. Conversations in Aurora follow a tree structure. All conversations start with a root. Branches from that root express any further dialogue. To add some player responses, right click the conversation node you just added and click “Add” again. Type in “Alright, be right back.” and click “Ok”.
19. The player might not want to fetch the rum, so let’s add another response in the same way. This time, give it the text, “Get your own!” Your conversation should look like the screenshot below.

20. Save the conversation and name it “captain_convo”.
21. Since this is the first node in the “Root”, this conversation will automatically play when we speak with the Captain. We also want to add another conversation node to this conversation that will play after we agree to fetch the rum. Add one onto “Root” with the text “Your back! But where is me rum?”
22. Add a player response with the text, “I was just about to get it.”
23. You can add another response from the Captain to this in the same way. Add another line after “I was just about to get it” and give it the text, “Well, get a move on! I’m thirsty!” Make sure your conversation looks exactly like the screenshot below:

24. We want to be able to decline at this point, too. Instead of writing the same thing as in the previous conversation node, right click the “Get your own!” node and click copy.

Right click the “Your back!” node and click “Paste as Link”. This creates a link, meaning the same text will be shown and the same scripts will be fired.

25. Add one more conversation path to the “Root” node to match the screenshot below. Once you are done, save the conversation again and close the Conversation Editor.

[OWNER] - <FirstName>! I forgot me rum on board the Hispaniola. Be a good <lad/lass> and get it for me!
✔ Alright, be right back.[END DIALOGUE]
✔ Get your own![END DIALOGUE]
[OWNER] - Your back! But where is me rum?
✔ I was just about to get it.
✔ [OWNER] - Well, get a move on! I'm thirsty!
✔ Get your own![END DIALOGUE]
[OWNER] - Your back with me rum!
✔ Here you go, captain.
✔ [OWNER] - Ah that hits the spot. The crew should've cleared the trees by the cave. Head inside and find me some treasure!

26. The conversation needs to be attached to the Captain. Open up the Treasure Island area, and then find Captain Silver in the palette on the right. This will be in “ Creatures” → “Custom” → “NPCS” → “Humans”. Make sure you have selected the “Custom” filter instead of “Standard”. Right click Captain Silver and click on “Edit”.

27. Click on the triangle button beside the “Conversation” drop down box and select “captain_convvo”. Press “Ok” once you have done so.

28. We have added the conversation to the Captain’s blueprint in the palette, but the Captain we have placed in the area story was created from the old blueprint. Objects placed in areas are created from blueprints and do not automatically update, so he does not have the conversation attached yet.

Tip: Objects created from blueprints are called “instances” in the Aurora Toolset.

29. To update the Captain, right click Captain Silver in the palette and click on “Update Instances”. Click on “Yes” for the first dialog and then “No” on the second to update all Captain Silvers. This also works for updating appearances, tags, or anything else.
30. Save your module and test it by pressing F9. Try speaking with the Captain. You will notice that only the first conversation path is played! This is because you need to add scripts to disable a previous conversation node in order to move onto the next one. Let’s use ScriptEase II to do that. Close Aurora and open your story in ScriptEase II again. You need to remember where you saved the SE2 story file, which is not the same as the module file you opened in Aurora.

Scripting Conversations:

31. Notice that a few new Game Objects have appeared under the “Dialogue” category in the Game Object pane, one for each of the lines we added. We will be using these in this

section.

32. Let's add another Cause to our story. This time, we will add the "When subject is reached" cause. Find it and drag it under the previous cause inside the only story point.
33. This cause takes a dialogue line as a parameter. Expand "captain_convoy" and "<FirstName>!..." , then drag the "Alright be right back" dialogue line to the subject.
34. Instead of adding our effects directly in the cause, we will be adding them to the Yes section of the "Is Active" question. Effects in the yes section of "Is Active" will only happen when the Story Point is active. The Treasure Island Story Point that we are in is active by default, so anything we add in here will happen when the dialogue line is reached, and if we have not passed this point in the story.
35. The Captain's rum is inside the Captain's Quarters, so let's unlock the door when we reach this point. In effects, search "unlock", and drag in the effect "Set the object to Unlocked" to the Yes section. Drag the Captain's Quarter's Door object into the object slot.
36. We also want to change what the Captains says when we reach this point. More specifically, we want him to say his next line. All conversation nodes are enabled by default, so all we have to do is disable the node we just finished with. Drag in the effect called "Disable dialogue line" to the same Yes section of the "Is Active" question. Drag the line beginning with "<First Name>! I forgot..." into the slot (Figure 4).

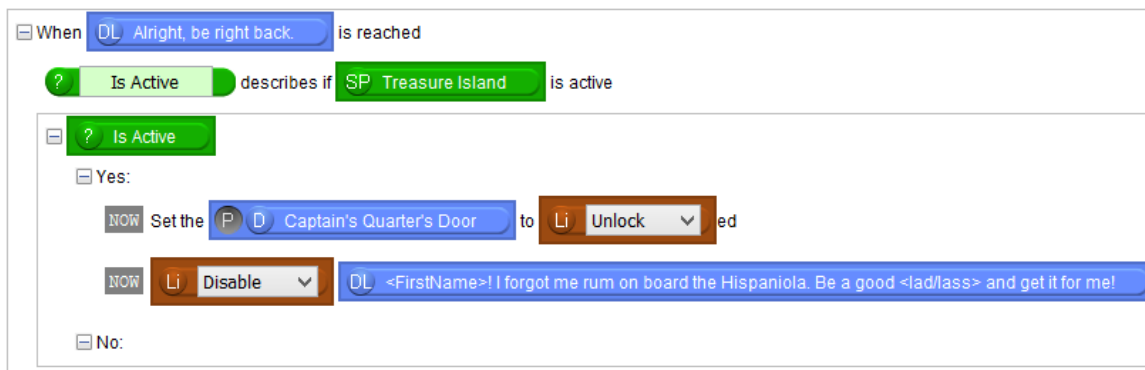

Figure 4

Tip: Notice that the link we created to the other node is light blue. Conversation links in NWN can be disabled and enabled independently of the original node. However, using the dialogue line in a "When dialogue line is reached" cause will fire the cause when either the original or the link is reached.

37. Save and test your story by pressing F9. Make sure the door unlocks and that the Captain changes his conversation when you talk to him again.

Descriptions:

38. That's all well and good, but I doubt the Captain would just stand by when you disobey him. Let's give him a proper response. Add another "When dialogue line is reached" cause to the story point, and drag in the "Get your own!" dialogue line as the subject.
39. Let's make the Captain yell at the player. Drag an effect called "Speaker speaks text at talk volume" directly into the cause (above "Is Active"). This is similar to the previous effect we dragged into the Pirate Flag's cause, except we can specify the speaker.
- Tip:* We don't use the previous effect because the subject would be the dialogue line; dialogue lines do not speak, they are spoken.
40. Drag in "Captain Silver" to the speaker slot, and write "You'll die for your insolence!" in the text field. Change "Talk" to "Shout".
41. We've made the pirate say that the player will die, but he won't live up to his word unless we script him to. Drag in an effect called "Attacker attacks Target" into the cause. In this case, the Attacker is Captain Silver. As a shortcut, you can drag the Captain Silver object from the previous line into this one.
42. We still need a target. If you check the game objects, you will notice that the player is not listed there. Players are not physical entities in our module until we play the game, so we need another way to add them to our story. This is where Descriptions come into use.
- Tip:* **Descriptions** are used to access game objects that can only be resolved during gameplay. For example, the nearest door to another object depends on where the object currently is when you play the game.
43. Click the Descriptions tab at the top left corner. In this case, we need to find "The Player Character describes The Player Character" description and drag it in between the two effects. **It needs to come before the effect that will use it or else we will not be able to drag the player character into the effect; order matters.**
44. Drag the newly created Player Character object into the Target slot.

45. Reorganize any effects if they have fallen out of order and rebind any slots that have become unbound. You can also disable the “Is Active” description and question since we won’t be using it for this cause by selecting them and pressing Ctrl + E (Figure 5). Disabled lines will do nothing to the game. You can simply delete “Is Active”, but disabling it allows you to quickly get them back (by pressing Ctrl + E again) if you ever want to use them again in the future.

Figure 5

46. Save and test your story again. The captain should now kill the player when they disobey orders. This will also work in the other conversation, where we linked the text.

Good job, you’ve finished the second tutorial! Your world is more alive now, and you have added the first step of the story.

You might notice that ScriptEase II saves and reads from a separate *.ses file. This file remembers all of the causes, effects, and other story components you have added to a story. It is also linked to the module. Therefore, this file is just as important as the module to work on your story. Keep backups of this, too! However, the file is not necessary to play your module, so do not include it in the final release to the public.

In the next tutorial, we will continue our story using Story Points and the story graph.
